Font used by Krillion: display typeface VT323

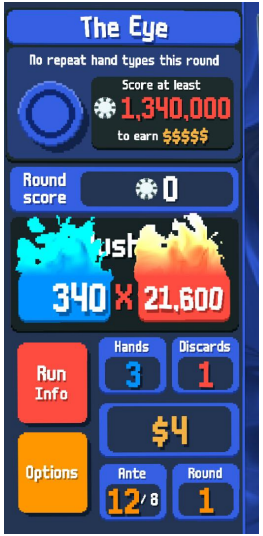

Font used by Final Fantasy VII: custom-designed font

Font used by Undertale: 8-Bit Operator

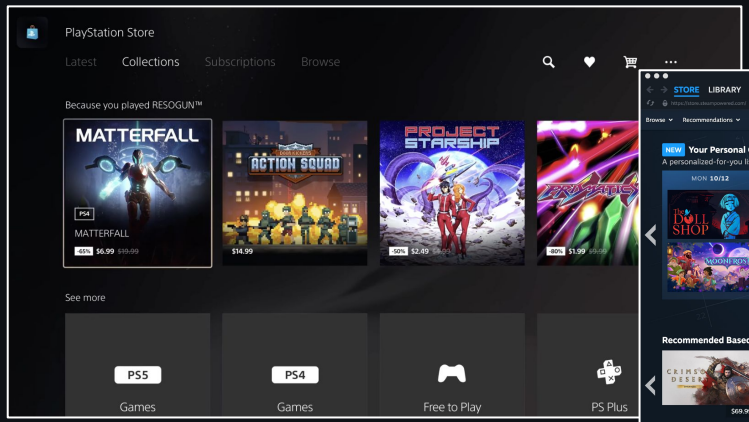

Font used by Balatro (above): pixel font m6x11

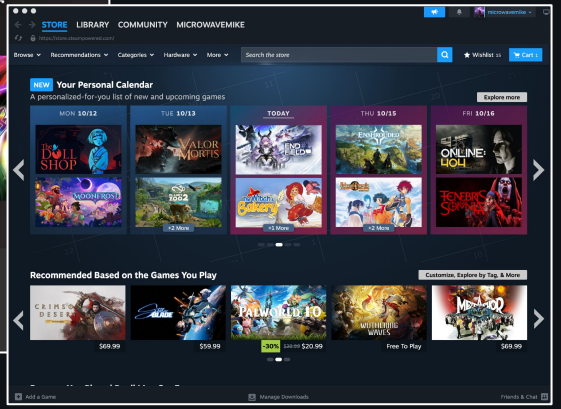

Fonts I used below: Pixelify Sans for large heading and Geist Pixel for some important body text. I will use the same in my website.

TYPOGRAPHY STUDY:

From these examples, we can see the appeal of using pixel art to evoke a retro aesthetic. These examples come from games and websites. However, only one of these images is actually "retro" (a game from 1997). Everything else is from 2015 and later, when video games and text rendering had already advanced past pixelation. Still, it's clear that the retro feeling is preserved and still sought after even today. Some cons are that pixelated fonts are sometimes less readable, so I would use it for the bigger text + title, but make small text more readable using a more common font.

Font I used on this slide for all small text: Archivo (nice, clear sans serif font readable at small sizes. I will use for body text in app)

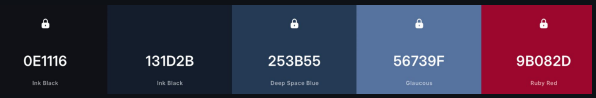

Color study:

The Steam store itself has a dark blue background with a few colorful accents (a gradient to purple across some cards, and green to show sale items). The PlayStation store sticks to a simple, plain black background. I agree that a dark background allows various video game cover arts to stick out well.

Regarding accent colors, I like the Steam dark blue background and red accent combo (especially for pages that don't have tons of video game covers on them). This combination of colors is often used in video games and the colors contrast nicely. See the above color palette
